

2009 Long-term average rainfall (mm)

The following table shows the historical rainfall data used in claim calculations for underwriting areas under the Forage Rainfall Plan. The 40-year values were derived from Environment Canada and Agricorp records. Data from stations within and adjacent to the areas were evaluated and verified for accuracy. This data was used to determine a long-term average monthly rainfall for the months of May, June, July, and August for each area. Agricorp determines regional boundaries for underwriting areas based on 1996 county boundaries. Agricorp determines the rainfall stations that fit with these areas based on longitude and latitude. Long-term averages are reviewed on maps to determine any abnormal weather patterns or significant differences within an area. Final underwritten values are determined for underwriting areas.
