

2024 Long-term average rainfall (mm)

The following table shows the historical rainfall data used in claim calculations under the forage rainfall plan. The 30-year values were derived from Environment Canada and Agricorp records. This data was used to determine a long-term average monthly rainfall for May, June, July, and August for each area. Agricorp determines regional boundaries for underwriting areas based on 1996 county boundaries. Agricorp determines the rainfall stations that fit with these areas based on longitude and latitude. Long-term averages are reviewed on maps to determine any abnormal weather patterns or significant differences within an area.
